Does the diagram exhibit correct notation?

- Do all the entities have a key? Do any weak entities that need a partial key have one?

yes, each strong entity has a pk

- Do all weak entities have at least one identifying relationship?

yes, is a guest a key for the reservation

- Do the relationships have the correct cardinality?

some N to M relationships which can be handled more efficiently

- Do any entities have attributes that seem to refer to other entities? This is not correct.

hotel id and any other FK that either identifies the entity or should not.
in Reservation

Ask the team to explain their design:

- Consider how the design handles the issue of the cost of a reservation. Assume that at least one hotel instance and a room type and season instance (for that hotel) exist. Is it possible to calculate the cost of a reservation that spans multiple days?

cost should be figured out with some solution

season attached to reservation

- Consider how the design handles guest types. Would it be possible for the hotel chain to change the discount offered to seniors from 10% off to 15% off?

look over how to handle discount

- Consider how the design handles reviews. Is it possible to know the dates of stay in a particular hotel that a review applies to?

Maybe attach it to the reservation or some way to know which review is attached to what period of stay for the guest.

Self Assessment

- Have you included one extra service, of your own choice, for your hotel?

Yes, ordered food

- Have you written up your assumptions and decisions?

Yes, document submitted including explanations for decisions

- If you deviated from standard notation, did you include a legend/key?

legend/key was included, don't think we deviated from standard notation

Reflection

After hearing comments from your peers, what areas in your model do you plan to revise?
